#### Abstract

Abstrak This study aims to analyze a suitable forecasting model using ARIMA to help PT. KAI Indonesia in predicting the number of train passengers in Jabodetabek. This study uses the method of identifying forecasting patterns. Model selection is very important in forecasting because forecasting models are beneficial for forecasting using past data in the past. The sample used is the number of Jabodetabek train passengers from January 2014 to December 2016. The results show that the suitable forecasting method to predict the number of Jabodetabek train passengers is the ARIMA method ( $3,1,6$ ). The results from this analysis can be used for considering to calculate operational costs and business development in the future.

Keywords: ARIMA, Forecasting, Jabodetabek Train Passenger, Time Series.Analysis

## INTRODUCTION

Jabodetabek is a metropolitan area consisting of Jakarta, Bogor, Depok, Tangerang, Bekasi. The people in Jabodetabek, in carrying out their daily activities, sometimes need to go from one place to another. Various public transportation facilities, including trains and buses, are available to facilitate this. The train is a practical transportation choice because it will not be affected by traffic jams in Jabodetabek, and the price is economical. This has encouraged many Jabodetabek people to choose trains as the most desirable transportation.

The number of train passengers in Jabodetabek is a reference that can be used to conduct research using the Box-Jenkins Time Series forecasting method, especially the AutoRegressive Integrated Moving Average (ARIMA) model. Many previous studies used ARIMA model to forecast the number of train passenger. In (Ria \& Indrasetianingsih, 2016), forecasting the number of train passenger using ARIMA method. The results show that the best time series model analysis for forecasting the number of Java train passenger is ARIMA model $(1,1,0)(0,1,1)^{12}$, because it has smallest RMSE value dan the MAPE value under $10 \%$ which is $9.8 \%$ compared with the other model. Also, in (Hidayat, 2019), analyzing forecast the number of Penataran train passenger using ARIMA and Exponential Smoothing. The results show that forecasting with ARIMA can produce the highest forecasting value if compared with Exponential Smoothing-Winter Method, and the number of passengers in previous years. Arima Box Jenkins Method is more suitable to to determining the number of passengers in the future, because the accuracy value is smaller compared with Exponential Smoothing-Winter Method.

Forecasting is an important tool in effective and efficient planning. Perspectives on forecasting may be as diverse as those of any other group of scientific methods. An institution always sets
goals and objectives, tries to estimate environmental factors, then determines the actions that are expected to achieve these goals and objectives. This study discusses the forecasting model for the number of Jabodetabek train passengers in 2017 using sample data on the number of Jabodetabek train passengers from January 2014 to December 2016.

This forecasting aims to take strategic steps that need to be done. The choice of the forecasting model is also very important because each type of data has a different model. Based on these conditions, the problem in this study is which forecasting model is most suitable for forecasting data on the number of Jabodetabek train passengers.

## METHOD

## A. Introduction of Time Series Models

The time series method is a forecasting method that analyzes the relationship pattern between the variables to be estimated and the time variable. Forecasting a time series data needs to pay attention to the type or pattern of data. There are four types of time series data patterns, namely horizontal, trend, seasonal, and cyclical (Hanke \& Wichers, 2005). Horizontal patterns are unexpected and random events, but their occurrence can affect fluctuations in time series data. The trend pattern is the tendency of the direction of the data in the long term, and it can be in the form of an increase or decrease. Seasonal patterns are fluctuations in data that occur periodically within one year, such as quarterly, quarterly, monthly, weekly, or daily. While the cyclical pattern is a fluctuation of the data for more than one year (Lisnawati, 2012). The method that is often used is the Box-Jenkins ARIMA method which is used to process univariate time series, and the transfer function analysis method is used to process time-series data. Multivariate. To be processed using the BoxJenkins ARIMA method, a time series data must meet the stationarity requirements (Makridakis, 1999).
B. Stochastic Process

The presentation of this section refers to (Cryer \& Chan, 2008). In mathematics, especially in probability theory and statistics, a stochastic process is a collection of random variables $X_{t}$ where $t$ is a parameter of a set of indices (usually corresponding to a discrete-time unit with the set of indexes $\{1,2, \ldots\}$ ). The stochastic process is one way to quantify the relationship between a set of random events. Therefore, stochastic processes are often used to model a system that changes randomly over time, such as in finance, biology, and others. A stochastic process is generally denoted as $\left\{X_{t}\right\}_{t \in T}$ or $\left\{X_{t}\right\}$. There are several ways to classify a stochastic process, for example, by using the cardinality of its index set and the conditioned space. When the set of indices is interpreted as time and has a finite or calculated cardinality (for example, the set of natural numbers), we call it a discrete-time stochastic process. If the set of indices is an interval of real numbers, we call it a continuous-time stochastic process. There are two examples of stochastic processes:

- Bernoulli Process

The Bernoulli process is one of the simplest stochastic processes. This process is a collection of identically distributed independent random variables (iid) with a value of 0 or 1 with probabilities $p$ and $1-p$, respectively. This process can be associated with repeatedly tossing a coin (which may be unfair).

- Markov Process

A Markov process is a stochastic process that satisfies the Markov condition. Given the situation at the current time, the probability of an event in the future is not affected by additional information regarding past behaviour. Formally,

$$
\begin{equation*}
\operatorname{Pr}\left\{X_{n+1}=j \mid X_{0}=i_{0}, \ldots ., X_{n-1}=i_{n-1}, X_{n}=i\right\}=\operatorname{Pr}\left\{X_{n+1}=j \mid X_{1}\right\} \tag{1}
\end{equation*}
$$

## C. Stationary

The presentation of this section refers to (Cryer \& Chan, 2008). To make statistical conclusions about the structure of a stochastic process based on the observed records, we usually have to make some simplifying (and possibly reasonable) assumptions about that structure. The most important assumption is the assumption of stationarity. The basic idea of stationarity is that the laws of probability that govern the behaviors of processes do not change over time. In a sense, the process is in statistical equilibrium. Specifically, a process $\left\{Y_{t}\right\}$ is said to be completely stationary if the joint distribution $Y_{t_{1}}, Y_{t_{2}}, \ldots, Y_{t_{n}}$ equals the shared distribution $Y_{t_{1}-k}, Y_{t_{2}-k}, \ldots, Y_{t_{n}-k}$ for all time point options $t_{1}, t_{2}, \ldots, t_{n}$ and all $k$ time lag options.

Thus, when $n=1$, the (univariate) distribution of $Y_{t}$ equals the distribution of $Y_{t-k}$ for all $t$ and $k$; in other words, $Y$ (slightly) is identically distributed. It then follows that $E\left(Y_{t}\right)=$ $E\left(Y_{t-k}\right)$ for all $t$ and $k$ so that the average function is constant for all time. Moreover, $\operatorname{Var}\left(Y_{t}\right)=\operatorname{Var}\left(Y_{t-k}\right)$ for all $t$ and $k$ so that the variance is also constant over time.

Setting $n=2$ in the definition of stationarity we see that the bivariate distribution of $Y_{t}$ and $Y_{s}$ must equal $Y_{t-k}$ and $Y_{s-k}$ so that $\operatorname{Cov}\left(Y_{t}, Y_{s}\right)=\operatorname{Cov}\left(Y_{t-k}, Y_{s-k}\right)$ for all $t, s$, and $k$. Putting $k=s$ and then $k=t$, we get

$$
\begin{align*}
\gamma_{t, s} & =\operatorname{Cov}\left(Y_{t-s}, Y_{0}\right) \\
& =\operatorname{Cov}\left(Y_{0}, Y_{s-t}\right) \\
& =\operatorname{Cov}\left(Y_{0}, Y_{|t-s|}\right) \\
& =\gamma_{0,|t-s|} \tag{2}
\end{align*}
$$

The covariance between Yt and Ys is time-dependent only through the time difference $|\mathrm{t}-\mathrm{s}|$ and not vice versa at the actual time $t$ and $s$. So, for a stationary process, we can simplify the notation and write it

$$
\begin{equation*}
\gamma_{k}=\operatorname{Cov}\left(Y_{t}, Y_{t-k}\right) \quad \text { and } \quad \rho_{k}=\operatorname{Corr}\left(Y_{t}, Y_{t-k}\right) \tag{3}
\end{equation*}
$$

also note that

$$
\begin{equation*}
\rho_{k}=\frac{\gamma_{k}}{\gamma_{0}} \tag{4}
\end{equation*}
$$

If a process is completely stationary and has a finite variance, the covariance function must depend only on the time lag.

## D. Auto Correlation Function (ACF) and Partial Autocorrelation Function (PACF)

The presentation of this section refers to (Cryer \& Chan, 2008). In the time series method, the primary way to identify a model from a data to forecast is to use the Autocorrelation Function (ACF) and Partial Autocorrelation Function (PACF). According to (Wei, 2006), from the stationary process of time series data $\left(X_{t}\right)$ obtained $E X_{t}=\mu$ and the variance of $\operatorname{Var} X_{t}=E\left(X_{t}-\mu\right)^{2}=\sigma^{2}$ which is constant, and the covariance $\operatorname{Cov}\left(X_{t}, X_{t+k}\right)$, whose function is only on the time difference $|t-(t-k)|$.

Then, the result can be written as an intermediate covariance $\mathrm{X} \_t$ and $\mathrm{X} \_(\mathrm{t}+\mathrm{k})$ as follows:

$$
\gamma_{k}=\operatorname{Cov} X_{t}, X_{t+k}=E X_{t}-\mu X_{t+k}-\mu
$$

And the correlation between $X_{t}, X_{t+k}$ :

$$
\begin{equation*}
\rho_{k}=\frac{\operatorname{Cov}\left(X_{t}, X_{t+k}\right)}{\operatorname{Var}\left(X_{t}\right) \operatorname{Var}\left(X_{t+k}\right)}=\frac{\gamma_{k}}{\gamma_{0}} \tag{6}
\end{equation*}
$$

Where the notation $\operatorname{Var} X_{t}=\operatorname{Var} X_{t+k}=\gamma_{0}$. As a function of $k \gamma_{k}$, where the autocovariance and $\rho_{k}$ functions are called autocorrelation functions (ACF), in the time series analysis $\gamma_{k}$ and $\rho_{k}$ describe the covariance and correlation between $X_{t}$ and $X_{t+k}$ from the same process, only separated from lag-k .

The sample of the autocovariance function and the sample of the autocorrelation function can be written as:

$$
\begin{equation*}
\gamma_{k}=\frac{1}{T} T-k X_{t}-X X_{t+k}-X \tag{7}
\end{equation*}
$$

and

$$
\rho_{k}=\frac{\gamma_{k}}{\gamma_{0}}=\frac{\begin{array}{c}
T-k  \tag{8}\\
t=1
\end{array} X_{t}-X X_{t+k}-X}{X_{t}-X^{2}}, k=0,1,2, \ldots .
$$

with

$$
X=\frac{1}{T}{ }_{t=1}^{T} X_{t}
$$

The autocovariance function $\gamma_{k}$ and the autocorrelation function $\rho_{k}$ have the following characteristics:

$$
\gamma_{0}=\operatorname{Var} X_{t} ; \rho_{0}=1
$$

1) $\left|\gamma_{k} \leq \gamma_{0} ;\right| \rho_{k} \leq 1$
2) $\gamma_{k}=\gamma_{-k}$ and $\rho_{k}=\rho_{-k}$ for all $k, \gamma_{k}$ and $\rho_{k}$ in the function lag $k=0$ are the same and symmetrical. This property is obtained from the time difference between $X_{t}$ and $X_{t+k}$. Therefore, the autocorrelation function is often only plotted for non-negative lags. Such plots are sometimes called correlograms.

## E. Model of Time-Series

The presentation of this section refers to (Cryer \& Chan, 2008).

- Model Autoregressive or AR(p)
$\operatorname{AR}(\mathrm{p})$ is the most basic linear model for stationary processes. This model can be interpreted as a process of regression results itself. Mathematically it is given by

$$
\begin{equation*}
X_{t}=\phi_{0}+\phi_{1} X_{t-1}+\phi_{2} X_{t-2}+\cdots+\phi_{p} X_{t-p}+a_{t} \tag{11}
\end{equation*}
$$

where $X_{t} \quad$ is data at time $t ; t=1,2,3, \ldots, \mathrm{n} . X_{t-i}$ is data at time $t-i, i=1,2,3, \ldots$, $\mathrm{p}, a_{t}$ is error on time $t, \phi_{0}$ is a constant, $\phi_{i}$ is AR coefficient; $i=1,2,3, \ldots, \mathrm{p}$

- Model Moving Average or MA(q)

The general form of a q-level or $\mathrm{MA}(\mathrm{q})$ moving average model is defined as:

$$
\begin{equation*}
X_{t}=\theta_{0}+a_{t}-\theta_{1} a_{t-1}-\theta_{2} a_{t-2}-\cdots-\theta_{q} a_{t-q} \tag{12}
\end{equation*}
$$

where $X_{t} \quad$ is data at time $t$ with $t=1,2,3, \ldots, \mathrm{n}, a_{t-i}$ is error at time $t-i$ with $i$ $=1,2,3, \ldots, \mathrm{q}, \theta_{0}$ is a constant, $\theta_{i}$ is MA coefficient with $i=1,2,3, \ldots, \mathrm{q}$.

- Model Autoregressive Moving Average or ARMA $(p, q)$

This model is a combination of $\operatorname{AR}(\mathrm{p})$ and $\operatorname{MA}(\mathrm{q})$. It can be expressed as $\operatorname{ARMA}(\mathrm{p}, \mathrm{q})$ with the general form:

$$
\begin{equation*}
X_{t}=\phi_{0}+\phi_{1} X_{t-1}+\cdots+\phi_{p} X_{t-p}+a_{t}-\theta_{1} a_{t-1}-\cdots-\theta_{q} a_{t-q} \tag{13}
\end{equation*}
$$

where $X_{t} \quad$ is data at time $t$ with $t=1,2,3, \ldots, \mathrm{n}, X_{t-i}$ is data at time $t-i$ with $i=$ $1,2,3, \ldots, \mathrm{p}, a_{t-i} \quad$ is error on period $t-i$ with $i=1,2,3, \ldots, \mathrm{q}, \theta_{0}$ is a constant, $\phi_{i}$ is AR coefficient with $i=1,2,3, \ldots, \mathrm{p}, \theta_{i}$ is MA coefficient with $i=1,2,3, \ldots, \mathrm{q}$.

- Model Autoregressive Integrated Moving Average or $\operatorname{ARIMA}(p, d, q)$

The ARMA $(\mathrm{p}, \mathrm{q})$ involving the differencing process with degree d will give us $\operatorname{ARIMA}(\mathrm{p}, \mathrm{d}, \mathrm{q})$. The general formula is written as follows:

$$
Z_{t}=\phi_{1} Z_{t-1}+\phi_{2} Z_{t-2}+\cdots+\phi_{p} Z_{t-p}+\cdots+d Z_{t-p-d} \varepsilon_{t}
$$

The summary of all process to find the best ARIMA model is given by Figure 5.

Figure 5. Box-Jenkins Method

## RESULT AND DISCUSSION

## A. Data Preparation

In this study, we use the secondary data of the number of of Jabodetabek train passengers of PT Kereta Api Indonesia from January 2014 until December 2016. This data is obtained from website of Badan Pusat Statistik Republik Indonesia (Badan Pusat Statistik, 2022) and presented at Table 1 below. All processing this data is helped by statistical software R.

Table 1. Number of Jabodetabek Train Passengers January 2014 - December 2016

| Date | Passenger | Date | Passenger | Date | Passenger |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 01 January 2014 | 15176.00 | 01 April 2015 | 21171.00 | 01 August 2016 | 23923.00 |
| 01 February 2014 | 14856.00 | 01 May 2015 | 22177.00 | $\begin{aligned} & 01 \text { September } \\ & 2016 \end{aligned}$ | 23570.00 |
| 01 March 2014 | 17471.00 | 01 June 2015 | 22207.00 | 01 October 2016 | 24533.00 |
| 01 April 2014 | 16671.00 | 01 July 2015 | 21171.00 | $\begin{aligned} & 01 \text { November } \\ & 2016 \end{aligned}$ | 24104.00 |
| 01 May 2014 | 16781.00 | 01 August 2015 | 22295.00 | $\begin{gathered} 01 \text { December } \\ 2016 \\ \hline \end{gathered}$ | 24841.00 |
| 01 June 2014 | 17848.00 | 01 September 2015 | 22021.00 |  |  |
| 01 July 2014 | 16585.00 | 01 October 2015 | 22964.00 |  |  |
| 01 August 2014 | 17091.00 | 01 November 2015 | 22355.00 |  |  |
| 01 September 2014 | 18253.00 | 01 December 2015 | 22996.00 |  |  |
| 01 October 2014 | 19079.00 | 01 January 2016 | 22238.00 |  |  |
| 01 November 2014 | 18605.00 | 01 February 2016 | 21229.00 |  |  |
| 01 December 2014 | 20080.00 | 01 March 2016 | 23206.00 |  |  |
| 01 January 2015 | 19244.00 | 01 April 2016 | 23149.00 |  |  |
| 01 February 2015 | 17640.00 | 01 May 2016 | 24401.00 |  |  |
| 01 March 2015 | 21290.00 | 01 June 2016 | 23821.00 |  |  |

## B. Stationary Check

The plot of the data is presented by Figure 8. From the figure, we found that there is fluctuation and increasing over time. Figure 9 show the plot data after first differencing process. The next step, we need to stationarity checking by using the ADF test. The condition for stationarity of data is that the p -value is less than 0.05 . The result of checking stationarity using R studio give us the p-value of ADF test is 0.5009 , which means that this data is not stationary. The next step is differencing the data. After this process, we obtain pvalue $=0.01$. Since this value is less than 0.05 , we conclude that the data is already stationary. From this, we also get that the degree of differencing is $d=1$.

Figure 8. Plot Before Differencing

Figure 9. Plot After First Differencing

Figure 11. ACF After First Differencing

This is the P Plot (ACF). According to Figure 11, we can see that the numbers traversed by the blue dotted line are number 1 and number 12 or we can say it's $P$.

This is the Q Plot (PACF). On figure 13, we can see that the numbers traversed by the blue dotted line are 1,4 , and 7 , and for this we can say it's Q .

## C. Model Spesification

In this analysis, we choose ( $\mathrm{p}, \mathrm{d}, \mathrm{q}$ ) $=(4,1,12)$. Table 2 below present some random numbers so that 35 different models are formed.

Table 2. ARIMA model data specifications

| Model <br> ARIMA | P | D | Q |
| :---: | :---: | :---: | :---: |
| ARIMA <br> (4,1,12) | 4 | 1 | 12 |

| ARIMA <br> $(0,1,6)$ | 0 | 1 | 6 |

## D. Parameter Estimation

The following are parameter estimates for all ARIMA models. After knowing the results of the ARIMA model, we can determine the estimated coefficients consisting of AR1, AR2, MA1, Mean Square Error (MSE), Log-likelihood, AIC, and MAPE, which will be considered for forecasting later. AR1, AR2, MA1, Log-Likelihood, and AIC were calculated using Rstudio. Meanwhile, MSE and MAPE were calculated using excel.

Table 3. ARIMA Parameter Estimation

| MODEL <br> ARIMA | COEFFICIENT OF ESTIMATION RESULT |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | AR1 | AR2 | MA1 | MSE | LOG <br> LIKEHOOD | AIC | MAPE |
| $\begin{gathered} \hline \text { ARIMA } \\ (4,1,12) \end{gathered}$ | $-0.5335$ | -0.2907 | -0.0259 | 4657594.167 | -281.59 | 595,17 | 91.13\% |

## E. Residual Analysis

In residual analysis, we can determine which model is best for our data using the Shapiro and Ljung's tests. The basic requirement needed to become the best model is to pass both tests, with the p -value criteria being more than 0.05 .

Table 4. ARIMA Analysis Residual

| Model ARIMA | Shapiro Test | Ljung-Box | AIC | MAPE |
| :---: | :---: | :---: | :---: | :---: |
|  | p-value | p-value |  |  |
| ARIMA (4,1,12) | 0,8845 | 0,6526 | 595,17 | 91.13\% |
| ARIMA (4,1,11) | 0,3488 | 0,9468 | 600,74 | 79.69\% |
| ARIMA ( $4,1,10$ ) | 0,9479 | 0,5204 | 601,13 | 67.77\% |
| ARIMA ( $4,1,9$ ) | 0,9287 | 0,4906 | 599,17 | 66.61\% |
| ARIMA (4,1,8) | 0,9901 | 0,9854 | 600,2 | 60.98\% |
| ARIMA (4,1,7) | 0,8727 | 0,9445 | 598,46 | 56.61\% |
| ARIMA (4,1,6) | 0,8026 | 0,9647 | 596,47 | 56.29\% |
| ARIMA ( $3,1,12$ ) | 0,7049 | 0,6345 | 597,76 | 75.18\% |
| ARIMA ( $3,1,11$ ) | 0,4745 | 0,9497 | 598,77 | 88.00\% |
| ARIMA ( $3,1,10$ ) | 0,5333 | 0,9467 | 597,48 | 57.64\% |
| ARIMA (3,1,9) | 0,5548 | 0,9024 | 595,53 | 59.38\% |
| ARIMA (3,1,8) | 0,995 | 0,995 | 598,23 | 63.08\% |
| ARIMA ( $3,1,7$ ) | 0,4829 | 0,5287 | 599,67 | 88,75\% |
| ARIMA ( $3,1,6$ ) | 0,8464 | 0,942 | 594,49 | 56.61\% |
| ARIMA ( $2,1,12$ ) | 0,705 | 0,6388 | 595,77 | 75.91\% |
| ARIMA (2,1,11) | 0,9346 | 0,7208 | 594,23 | 72.75\% |
| ARIMA ( $2,1,10$ ) | 0,7813 | 0,7316 | 598,54 | 57.24\% |
| ARIMA ( $2,1,9$ ) | 0,6465 | 0,6599 | 598,81 | 59.18\% |
| ARIMA ( $2,1,8$ ) | 0,907 | 0,9861 | 596,25 | 58.00\% |
| ARIMA (2,1,7) | 0,4895 | 0,5096 | 598 | 93.02\% |
| ARIMA ( $2,1,6$ ) | 0,5435 | 0,5055 | 595,98 | 92.15\% |
| ARIMA (1,1,12) | 0,714 | 0,6404 | 593,77 | 75.69\% |
| ARIMA (1,1,11) | 0,8174 | 0,5982 | 598,73 | 56.93\% |
| ARIMA (1,1,10) | 0,8255 | 0,4033 | 597,06 | 54.96\% |
| ARIMA (1,1,9) | 0,6154 | 0,6743 | 596,87 | 57.93\% |
| ARIMA (1,1,8) | 0,6076 | 0,4316 | 598,56 | 93.69\% |
| ARIMA (1,1,7) | 0,5096 | 0,4747 | 596,08 | 93.52\% |
| ARIMA (1,1,6) | 0,745 | 0,312 | 595,1 | 85.21\% |
| ARIMA ( $0,1,12$ ) | 0,5605 | 0,3405 | 592,43 | 72.36\% |
| ARIMA ( $0,1,11$ ) | 0,4784 | 0,9591 | 599,21 | 69.64\% |
| ARIMA ( $0,1,10$ ) | 0,6293 | 0,6583 | 596,87 | 57.91\% |
| ARIMA (0,1,9) | 0,5398 | 0,7855 | 594,91 | 58.43\% |
| ARIMA (0,1,8) | 0,4865 | 0,571 | 595,69 | 85.53\% |
| ARIMA (0,1,7) | 0,6366 | 0,413 | 594,65 | 93.85\% |
| ARIMA (0,1,6) | 0,69 | 0,63 | 593,31 | 90.48\% |

However, in this table, all data passed the Saphiro and Ljung-Box tests. In this case, we will then use the smallest MAPE value of the smallest AICs. The line that I marked in
blue, or what we can call the ARIMA 14 model $(3,1,6)$, is the best model. The model has equation

$$
\begin{align*}
& W_{t}=0.6939_{1} W_{t-1}-0.0468_{2} W_{t-2}+0.3525_{3} W_{t-3}+e_{t}+1.2646_{1} e_{t-1}- \\
& 0.3943_{2} e_{t-2}+0.2190_{3} e_{t-3}+0.3633_{4} e_{t-4}-1.1709_{5} e_{t-5}+0.7062_{6} e_{t-6} \tag{15}
\end{align*}
$$

where $W_{t}=Y_{t}-3 Y_{t-1}+3 Y_{t-2}-Y_{t-3}$
F. Error of The Forecasting

In this part, we will calculate the error of the forecasting from the best model ARIMA $(3,1,6)$. Here we define the error, squared error, percentage, MSE, RMSE, MAE, and MAPE.

Table 5. Calculate Error Best Model

| Point Forecast | Actual Data | Error | Error <br> (Kuadrat) | Percentage |
| :---: | :---: | :---: | :---: | :---: |
| 25326,72 | 24185 | 1303524,558 | 1141,72 | $4,72 \%$ |
| 24895,32 | 21743 | 9937121,382 | 3152,32 | $14,50 \%$ |
| 25902,03 | 25775 | 16136,6209 | 127,03 | $0,49 \%$ |
| 24998,14 | 25411 | 170453,3796 | 412,86 | $1,62 \%$ |
| 26130,75 | 27385 | 1573143,063 | 1254,25 | $4,58 \%$ |
| 26499,42 | 24432 | 4274225,456 | 2067,42 | $8,46 \%$ |
| 26383,6 | 27016 | 399929,76 | 632,4 | $2,34 \%$ |
| 26685,18 | 27679 | 987678,1924 | 993,82 | $3,59 \%$ |
| 27029,83 | 26158 | 760087,5489 | 871,83 | $3,33 \%$ |
| 27214,02 | 28765 | 2405538,96 | 1550,98 | $5,39 \%$ |
| 27431,99 | 28246 | 662612,2801 | 814,01 | $2,88 \%$ |
| 27696,1 | 29059 | 1857496,41 | 1362,9 | $4,69 \%$ |

After calculation we obtain of the MSE, RMSE, MAE, and MAPE are 1739139,115, 1318,764238 , and $56,61 \%$, respectively.

## G. Forecasting

Then we enter into the forecasting stage. What will be predicted in this experiment is the number of Jabodetabek train passengers from January 2017 to December 2017 using ARIMA $(3,1,6)$ and a confidence interval of $95 \%$.

Table 9. Forecasting Data Januari - Desember 2017

| Date | Actual Data | Point Forecast | Lower Limit | Upper Limit |
| :--- | :---: | :---: | :---: | :---: |
| 01 Januari 2017 | 24185 | 25326.72 | 23413.72 | 27239.73 |
| 01 Februari 2017 | 21743 | 24895.32 | 22810.02 | 26980.62 |
| 01 Maret 2017 | 25775 | 25902.03 | 23709.41 | 28094.65 |
| 01 April 2017 | 25411 | 24998.14 | 22582.57 | 27413.71 |
| 01 Mei 2017 | 27385 | 26130.75 | 23714.85 | 28546.65 |
| 01 Juni 2017 | 24432 | 26499.42 | 23586.82 | 29412.03 |
| 01 Juli 2017 | 27016 | 26383.60 | 23096.04 | 29671.16 |
| 01 Agustus 2017 | 27679 | 26685.18 | 23224.97 | 30145.39 |
| 01 September 2017 | 26158 | 27029.83 | 23334.68 | 30724.97 |
| 01 Oktober 2017 | 28765 | 27214.02 | 23251.52 | 31176.52 |
| 01 November 2017 | 28246 | 27431.99 | 23244.23 | 31619.75 |
| 01 Desember 2017 | 29059 | 27696.10 | 23289.30 | 32102.89 |

Figure 18 shows the results of forecasting the number of Jabodetabek train passengers in every month in 2017. The black line shows the sample data used to perform this analysis. The red line shows the graph of ARIMA used for forecasting, while the blue line shows the data prediction.

Figure 18. Forecasting of the Passengers in 2017

## Conclusion

In the work, we have forecast the the number of of Jabodetabek train passengers of PT Kereta Api Indonesia from January 2017 until December 2017. The analysis result show that ARIMA $(3,1,6)$ is the best model The comparison between the predicted data and the actual data shows that the predicted data is not much different from the actual data. The total estimated number of passengers in 2017 is 316193 people. Meanwhile, according to actual data, the total number of passengers in 2017 was 315854 . Therefore, forecasting using the ARIMA method can be pretty accurate and effective when correctly choosing the best ARIMA model. This analysis is expected to be helpful in knowing the number of passengers on trains in Jabodetabek. Based on these predictions, PT Kereta Api Indonesia is able to prepare and anticipate if there is a surge in passengers in the future. This will help the company to make a business plan to improve services to passengers.

For further research, we will forecast Jabodatabek train passengers using the latest data and consider residual variance as well. In the case of variance of residual exist, the methods used in forecasting are ARCH and GARCH.
